

13: Trapezoidale - Kesselung über ($q_0 \frac{N}{m}$ im Kesselformfaktor)

• Ankerkräfte eintragen (Ax'z')

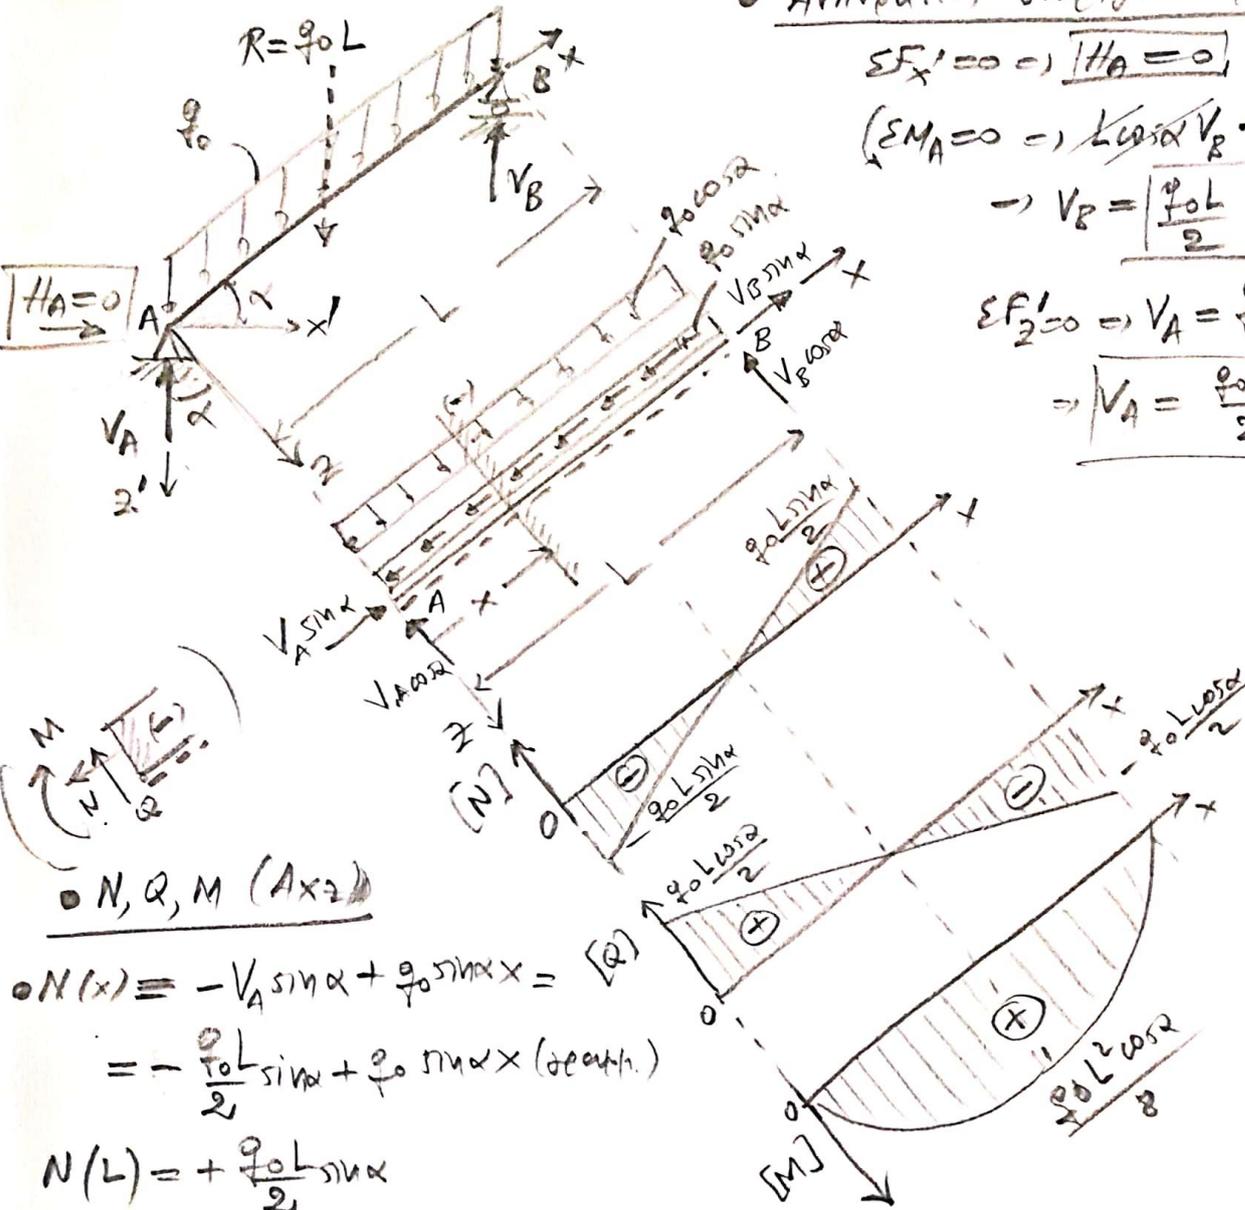

$\Sigma F_x' = 0 \Rightarrow H_A = 0$

$(\Sigma M_A = 0 \Rightarrow L \cos \alpha V_B - \frac{L \cos \alpha}{2} q_0 L = 0 \Rightarrow$

$\rightarrow V_B = \left[\frac{q_0 L}{2} \right]$

$\Sigma F_z' = 0 \Rightarrow V_A = q_0 L - \frac{q_0 L}{2} \Rightarrow$

$\rightarrow V_A = \left[\frac{q_0 L}{2} \right] (= V_B)$

• N, Q, M (Ax'z')

$N(x) = -V_A \sin \alpha + q_0 \sin \alpha x =$
 $= -\frac{q_0 L}{2} \sin \alpha + q_0 \sin \alpha x$ (beacht.)

$N(L) = +\frac{q_0 L}{2} \sin \alpha$

$Q(x) = V_A \cos \alpha - q_0 \cos \alpha \cdot x =$
 $= \frac{q_0 L}{2} \cos \alpha - q_0 \cos \alpha \cdot x$ (beacht.)

$Q(L) = -\frac{q_0 L \cos \alpha}{2}$

$M(x) = x V_A \cos \alpha - \frac{x}{2} q_0 \cos \alpha x = \frac{q_0 L \cos \alpha}{2} x - \frac{q_0 \cos \alpha}{2} x^2$ (beacht.)

$M(0) = 0, M(L) = 0$

Kesselform $\frac{d^2 M}{dx^2} = -q(x) = -q_0 \cos \alpha < 0$ flach

Kritik $\frac{dM}{dx} = Q(x) = -\frac{q_0 L \cos \alpha}{2} - q_0 \cos \alpha x = 0$ bei $x = \frac{L}{2}$, dann $M_{max} =$

$M_{max} = M\left(\frac{L}{2}\right) = \frac{q_0 L^2 \cos \alpha}{4} - \frac{q_0 L^2 \cos \alpha}{8} = \frac{q_0 L^2 \cos \alpha}{8}$
